January 13, 2011 - San Francisco, California. AEI Press Release 2011/01.

AMROHA Engineering Inc. extends IRIS Scanning features code-named Catcher-in-the-EyeTM from its security systems portfolio in to business process management systems.

San Francisco, California – 13 January 2011 – Amroha Engineering, Inc. introduced today its new automation tools employing iris identification for use in AEI's business process management systems.

Iris Scanning has been in active use for over a decade in access control and security applications at world's largest airports' departures and arrivals, and at the immigration and emigration controls at the borders. Iris images provide a positive identity verification mechanism. AEI's new automation tools seek to extend the high quality identification available from iris scanning to business process management in a variety of commercial applications, including but not limited to financial applications such as banking ATMs. One major advantage of using iris scanning for identification in various business processes is the throughput at control points, which reduces a business' operating costs.

Mr. Shams Naqvi, CEO of AEI, stated, "We are pleased that our Iris Scanning tools offering is set to potentially reduce the cost of products and services by improving human throughputs at various control points in a business process. We estimate that our tools will improve human throughput by at least 3 minutes per pass, which is expected to improve throughput costs by nearly 0.9 - 1.2 % in a medium traffic environment."

Application-specific pricing for Iris Scanning tools and integration services are available upon request.
